

Package ‘dsmSearch’

December 19, 2024

Type Package

Title DSM and LiDAR downloader

Version 1.1.0

Description A collection of functions to search and download DSM (Digital Surface Model) and LiDAR (Light Detection and Ranging) data via APIs, including 'OpenTopography' <<https://portal.opentopography.org/apidocs/>> and 'TNMAccess' <<https://apps.nationalmap.gov/tmaccess/#/>>.

Depends R (>= 4.1)

License GPL-3

Encoding UTF-8

RoxygenNote 7.3.1

Language en-US

Suggests testthat (>= 3.0.0), knitr, rmarkdown

VignetteBuilder knitr, rmarkdown

Imports dplyr, sf, sp, terra, lidR, httr2, imager

NeedsCompilation no

get_lidar *get_lidar*

Description

Search for and download LiDAR data based on coordinates of a spatial point with a given distance or a bounding box. The maximum distance is 1000m. Different dataset could be found and the function automatically downloads the latest dataset. To get more details of data on a larger scale, please use `viewscape::lidar_search`.

Usage

```
get_lidar(x, y, r, epsg, bbox, max_return = 500, folder)
```

Arguments

x	numeric, indicating Longitude degree of the center point.
y	numeric, indicating latitude degree of the center point.
r	numeric, indicating search distance for LiDAR data. The maximum distance is 1000m (3281ft). If $r > 1000m$, it will be reset to 1000m.
epsg	numeric, the EPSG code specifying the coordinate reference system.
bbox	vector, a bounding box defining the geographical area for downloading data.
max_return	numeric, indicating the maximum of returns.
folder	string (optional), indicating a path for downloading the LiDAR data

Value

lidR LAS object.

Examples

```
las <- dsmSearch::get_lidar(x = -83.741289, y = 42.270146, r = 1000, epsg = 2253)
las <- dsmSearch::get_lidar(bbox = c(-83.742282, 42.273389, -83.733442, 42.278724), epsg = 2253)
terra::plot(lidR::rasterize_canopy(las, 10, lidR::dsmtin()))
```
