

# Package ‘gglogger’

October 25, 2024

**Type** Package

**Title** Track 'ggplot2' Calls

**Version** 0.1.5

**Description** Provides a way to log 'ggplot' component calls, which can be useful for debugging and understanding how 'ggplot' objects are created. The logged calls can be printed, saved, and re-executed to reproduce the original 'ggplot' object.

**License** MIT + file LICENSE

**Imports** ggplot2, cli, methods

**Suggests** rlang, testthat

**RoxygenNote** 7.3.2

**Encoding** UTF-8

**URL** <https://github.com/pwwang/gglogger/>

**NeedsCompilation** no

**Author** Panwen Wang [aut, cre] (<<https://orcid.org/0000-0002-4614-8970>>)

**Maintainer** Panwen Wang <pwwang@pwwang.com>

**Repository** CRAN

**Date/Publication** 2024-10-25 09:10:02 UTC

<code>+.gg</code>	<i>Override + operator for ggplot objects to log calls</i>
-------------------	------------------------------------------------------------

---

### Description

Override + operator for ggplot objects to log calls

### Usage

```
## S3 method for class 'gg'
e1 + e2
```

### Arguments

<code>e1</code>	A ggplot object.
<code>e2</code>	A layer to add to the ggplot object.

### Value

A ggplot object with logged calls.

---

GGLog-class	<i>GGLog class</i>
-------------	--------------------

---

### Description

The ‘GGLog’ class is used to store a single ggplot call.

### Fields

<code>code</code>	A string to store the code of the ggplot call.
-------------------	------------------------------------------------

### Methods

<code>evaluate(envir = parent.frame())</code>	Evaluate the log. @param <code>envir</code> The environment to evaluate the log in.
<code>stringify()</code>	Stringify the log. @return A string.

GGLogs-class

*GGLogs class***Description**

The 'GGLogs' class is used to store logs of ggplot calls. Each log is stored as a 'GGLog' object. The object can be accessed using the '\$logs' field from a ggplot object.

**Fields**

logs A list to store the logs.

**Methods**

add(log) Add a log to the list.

@param log A GGLog object.

evaluate(envir = parent.frame()) Evaluate all logs in the list.

@param envir The environment to evaluate the logs in.

gen\_code(setup = "library(ggplot2)") Generate code for all logs in the list.

@param setup A string to setup the environment.

@return A string of code.

stringify() Stringify all logs in the list.

@return A string.

ggplot

*Override ggplot function to log calls***Description**

Override ggplot function to log calls

**Usage**

```
ggplot(...)
```

**Arguments**

... Arguments passed to ggplot2::ggplot.

**Value**

A ggplot object with logged calls.

---

print.GGLog	<i>Print a GGLog object</i>
-------------	-----------------------------

---

**Description**

Print a GGLog object

**Usage**

```
## S3 method for class 'GGLog'  
print(x, ...)
```

**Arguments**

x	A GGLog object.
...	Additional arguments.

**Value**

Display the logs and invisibly return the logs.

---

print.GGLogs	<i>Print a GGLogs object</i>
--------------	------------------------------

---

**Description**

Print a GGLogs object

**Usage**

```
## S3 method for class 'GGLogs'  
print(x, ...)
```

**Arguments**

x	A GGLogs object.
...	Additional arguments.

**Value**

Display the logs and invisibly return the logs.

---

register	<i>Register a function that returns a ggplot object This is usually implemented by ggplot extensions.</i>
----------	-----------------------------------------------------------------------------------------------------------

---

**Description**

Register a function that returns a ggplot object This is usually implemented by ggplot extensions.

**Usage**

```
register(f, name = NULL)
```

**Arguments**

f	A function that returns a ggplot object.
name	A string to represent the name of the function.

**Value**

A function that returns a ggplot object with logged calls.
