The **numname** package

S Joshua Swamidass

2007/07/05

This package converts a numerical number to the english spelled out name of the number. For example, 1 → one, 2 → two, 12 → twelve. It can also convert to the ordinal number, 1 → first, 2 → second, etc.

This code was cut and paste from the **memoir.cls** for use as an independent package for projects which prefer not to use the **memoir** class.
